Major-General John Gaspard Le Marchant
1766 – 1812

Le Marchant was a renowned cavalry general and military reformer who saw extensive service in the field against the French and exerted great influence and change on the British Army. As a 16 year-old Le Marchant had challenged his colonel, Lord Porchester, to a duel and also tried to have a duel with a civilian, but he matured and redirected his energy to military advancement and reform. His reforms went to the very core of the British Army and his legacy lives on to this day in the training and education of Army officers. He gained the support and friendship of King George III and his death was lamented by the Duke of Wellington, the Duke of York and many other notables. A monument to him stands in St.Paul’s Cathedral.

Family

Le Marchant was born in 1766 in Amiens, the son of John Le Marchant, who was a cavalry officer from one of the most important Guernsey families (hence the French name but British allegiance). His mother was from French aristocracy. Le Marchant went to school in Bath (where he was regarded as a troublemaker) and was raised as British. He married Mary, a neighbour from Guernsey, in 1789 and had 10 children with her. Mary died giving birth to their tenth child in 1811 at their house in High Wycombe.

Military Service

1781 - Joined the Wiltshire Militia.
1783 - Joined regular army as Ensign in the 1st Regiment of Foot.
1783-87 – Based at the Gibraltar garrison.
1787 - Transferred to the 6th Dragoons as a Cornet.
1789 – Transferred to the 2nd Dragoon Guards as a Lieutenant.
1791- Promoted to Captain.
1793-94 - Brigade Major in the Flanders campaign against the French.
1795-96 – Involved in creating new sword pattern and sword exercise for cavalry.
1797 – Promoted to Lieutenant-Colonel (Second-in-Command), 7th Light Dragoons.
1798 – Regimental Commander, 2nd Dragoon Guards.
1801 – Established two officer training colleges (became Royal Military Academy, Sandhurst).
1801-1810 – Lieutenant-Governor of the two colleges.
1811 – Promoted to Major-General
11 April 1812 – Led 5th Dragoon Guards to success at Villagarcia.
22 July 1812 – Led 3rd Dragoons, 4th and 5th Dragoon Guards to total victory at Salamanca, receiving a fatal gunshot wound in the process. He had allegedly killed 6 of the enemy with his own hand.

Cavalry Reform

His experience in Flanders during 1793-95 led Le Marchant to believe that reform was needed in the British cavalry, both in terms of equipment and training. He seems to have take inspiration from the Austrian cavalry in this case.

In collaboration with the renowned sword maker Henry Osborn, Le Marchant designed what was to become the 1796 Pattern light cavalry sabre. This became one of the most loved of British sword patterns and continued to be used around the world long after it had officially been super ceded in mainstream British service. It was also copied by the German states and produced throughout the 19th century. Later sword patterns were often compared unfavourably to the much loved ‘old British dragoon sabre’. In its time the 1796 light cavalry sabre was also emulated by infantry and naval officers who wanted more robust fighting swords and this led to the adoption of sabres for these services, replacing the old spadroons.

Le Marchant also authored the new ‘Regulations’ for cavalry sword exercise which this prologue appends and supports. Interestingly, the new 1796 light cavalry sabre is not shown in the manual, but rather what appears to be the old 1788 Pattern, no doubt because at the time of the manual being written then design of the new sabre had not been confirmed, authorised or adopted yet. These regulations became the standard work for cavalry and the Adjutant General Sir William Fawcett asked Le Marchant to arrange instruction to be given first-hand to regiments. It seems that Le Marchant conducted some training personally, with his brother-in-law Lieutenant Peter Carey, of the 16th Light Dragoons, assisting or giving the instruction by himself in other cases. Allegedly King George III made himself familiar with the new treatise, learning all the exercises.

Le Marchant also wrote other treatises which were not published, as well as various pamphlets about the training of officers and military strategy.

Prologue compiled and written by Matt Easton, of Schola Gladiatoria.

With thanks to:
Will Mathieison for obtaining the original treatise and graciously copying it and making it available to us.

RULES AND REGULATIONS
FOR THE
SWORD EXERCISE
OF THE
CAVALRY.
By His Majesty’s Command.

Adjutant General’s Office,
1st December, 1796.

RULES AND REGULATIONS
FOR THE
SWORD EXERCISE
OF THE
CAVALRY.

WAR OFFICE, PRINTED;
AND SOLD BY
T. EGERTON, MILITARY LIBRARY, WHITEHALL.
MDCCXCVI.
The following Rules and Regulations for the Sword Exercise, are, by His MAJESTY's Command, to be observed and practised by the Cavalry Corps in general, in His MAJESTY's Service.

By Command of Field Marshal, His Royal Highness The DUKE of YORK.

WILLIAM FAWCETT,
ADJUTANT GENERAL.
INTRODUCTION.

IT is His MAJESTY's pleasure, that the use and exercise of the Sword shall in future be regularly taught at the drills of the Cavalry, as an essential part of the instruction of a horsemans; and, in order to establish uniformity of execution on a proper system, the following regulations must be strictly observed.

The first principles are to be acquired and shewn on foot, under the direction of the adjutant, until such time as the squads are in a sufficient degree of forwardness to execute their lessons on horseback, when it will become the particular duty of the riding-master to instruct them in the mode by which horsemanship and the use of the sword are combined.

His
His Majesty's Regulations for the Formations, Movements, and Field Exercise, of the Cavalry, do not suffer the smallest alteration in the practice of this system, which is calculated to give the horseman, when acting singly, that decided advantage over an enemy, which horsemanship, and a conscious superiority in the use of his sword, must always produce.

RULES AND REGULATIONS

FOR THE

SWORD EXERCISE.

PART I.

THESE Regulations for the management of the Sword are laid down under the heads of Offensive and Defensive, whether with respect to Cavalry or Infantry; the whole being comprised in the following Movements:

I. Offensive, six Cuts.
II. Defensive against Cavalry, eight Guards.
III. The Point as applied generally.
IV. The Cut and Guard against Infantry.
RULES AND REGULATIONS.

I. CUTS.

THERE are only six ways of directing the Edge of the blade; therefore the different parts of the body, which may be exposed by the unskillfulness of a swordsman, are not to be (erroneously) conceived as admitting of so many distinct cuts. The action of the wrist and shoulder alone directs the blade; and they admit but of six movements, from which every cut is derived, wherever may be its particular application to the body. The direction of the stroke must depend on the openings given by the adversary, and be regulated by judgment, and experience in the use of the weapon.

To make a Cut with effect, and at the same time without exposing the person, there are two points which principally demand attention. The first is to acquire a facility in giving motion to the arm by means of the wrist and shoulder, without bending the elbow; for in bending the elbow, the sword-arm is exposed; a circumstance of which the opponent will ever be ready to take his advantage, as a cut in that quarter may be made with the greatest security; and if it be well directed, with the most fatal effect, as it at once decides the issue of the contest. The Cuts III. and IV. are particularly calculated to apply against the wrist.

The next object is to attain a correctness in applying the edge in the direction of the blade, otherwise it will turn in the hand; and as in that case the flat part must receive the whole force of the blow, it will in all likelihood be splintered to pieces.

From want of habit in the exercise of the wrist in the common occupations of life, the weight of the sword will at first be found extremely irksome. The action of the arm bears no comparison with that quickness of which the wrist is susceptible; for the motions of the arm are so wide and circuitous, that they are easily counteracted; from which, in a clear point of view, the strictest perseverance will be found necessary, in order to attain perfection in the first lessons; which are merely confined to acquiring a suppleness in the wrist and shoulder; as without this indispensable requisite, no person can become a good swordsman.

II. GUARDS.

Of the eight Guards against cavalry, five are for the protection of the rider and his horse in front, and three for the purpose of covering them, when under the necessity of retiring.

The principal position is distinguished from the rest by the term Guard, and the remaining seven by that of Protecūt. The Guard covers the head, shoulders, and sword-arm, from the cuts I. and II. as likewise from thosē
those of III. and IV. requiring, however, in the latter, a trifling inclination of the arm downwards: It is not only a position which affords greater security than any other, but is of such a nature as to render all the movements necessary to be made from it, easy, and of quick execution.

There are two other positions for the defence of the horseman in front; namely, the Left and Right Protegé. They consist simply in moving the sword-arm to the left and right of the bridle-hand. These Guards are calculated to give protection equally against the thrust, as against the cuts V. and VI.; and either in making or receiving a charge, where the compactness of the body of cavalry does not admit of using the edge of the blade, without danger to your own line. They are also well adapted in a moment of general confusion (which always takes place in the shock of two conflicting bodies) to afford a great degree of security, as by a quick transverse of the sword-arm, three or four times repeated from left to right, the blade can scarcely fail to meet whatever may be pointed in that direction, before it can reach the body.

The position generally known by the term Hanging Guard, protects the horse's head on the near side; and on the off side, it is covered by a guard very much resembling the Right Protegé.

The first of the three retiring guards is for the protection of the bridle-arm, and left side to the rear; the second for that of the right arm and shoulder: the last, which

which is the St. George, concludes the eight Guards, and is intended for the protection of the back of the head. The Guards to the rear are equally simple and efficacious with those laid down for protection in front; but the mode of carrying them into effect differs from the general principles of this system, as will appear from the drill exercise. Comparatively with the great variety of movements these Guards are calculated to meet, they are but few in number, and therefore more to be relied on, than when the defence depends on various circumvolutions of the blade, which in the first place, cannot be performed within so short a time; and in the second, must ever be rendered more uncertain, from the difficulty of execution.

III. The POINT.

THE thrust has only one mode of execution, whether applied to cavalry, or infantry: but a greater degree of caution is required in its application against cavalry, than against infantry: for if the point is parried, the adversary's blade gets within your guard, which is not to be recovered again in time, as with a small sword; the weapon being too heavy to be managed with the requisite degree of quickness.

The case is different in acting against infantry, as the persons, against whom you then direct your point,
are so much below your own level, that the weight of your sword is not felt; consequently it is managed with greater facility, than with an extended arm carried above the level of the shoulder. Therefore in many instances against infantry, the point may be used with as much effect as the edge, and with the same degree of security.

---

IV. The CUT and GUARD against INFANTRY.

In that part of the sword exercise which relates solely to its application against infantry, there are three movements, the point, the parry, and the cut. The execution of the two latter movements differs from the mode laid down in the general rules for practice. This difference is occasioned by the relative situation of the contending parties.

A person on horseback is elevated so much above those acting on foot, that it is necessary for him to bend his elbow, in order to take a sweep to give his cut with effect: and this may be securely done, as the sword-arm is not exposed in the contest. The thrust of a bayonet is parried, whether made on the near, or off-side, by forcing it backward or forward, as circumstances may direct; only it is to be observed, that the parry is made with the back of the blade, instead of exposing the edge.

---

DRILL
DRILL ON FOOT.

THAT a recruit may be more readily brought to comprehend the intention and object of the different directions in which he will be required to carry his blade, and at the same time in order to enable the drill officer to judge how far the motions are accurately executed; the recruit must be placed facing a wall, at the distance of six feet, but not so as to touch it with his sword when drawn.

Upon the wall, immediately in front of his position, describe a circle of two feet diameter, and full four feet from the ground, then draw two lines, which will divide the circle into four parts, each line being drawn diagonally; then a third line, forming an horizontal diameter; on the different points of those lines place the figures 1, 2, 3, 4, 5, 6, as represented in Plate I. fig. 1.

This will serve to convey the idea of that space, which an antagonist would occupy in point of height, and the recruit is to direct all his movements to it, upon that supposition; the figures denoting the six different cuts of the blade, which are to be applied in that given space.

His position must be erect, with his body square to the front, his head kept up, and eyes directed to the object before him. His heels two inches asunder, and...
and his arms hanging without constraint, keeping the points of his elbows back, his right hand flat on his thigh, his thumb to be on a line with the seam of his breeches; the left hand in the same manner, with his fingers on the scabbard to keep the sword steady, and in readiness to be drawn.

SWORD-KNOTS.

No sword must be made use of without having a sword-knot attached to it. It enables a person instantly to recover his weapon, if forced from his grasp; and in drills, prevents accidents which are liable to occur by the sword escaping from the hand, when not restrained.

The sword-knot is to be made of leather, not too thick, but capable of shaping itself to the wrist; yet it is not intended ever to confine the action of the wrist, which it would do if drawn tight; but it is to be of such a length as to admit of the sword-hilt shifting in the hand, which is necessary in giving point, and indeed in almost every movement in the exercise of the sword.

In whatever form the sword-knot may be worn, it is always to be loosed the moment a dragoon becomes mounted, in order to its being in readiness for use, whenever swords are required to be drawn.

DRAW-
DRAWING of SWORDS.

THE sword will be drawn, and brought to the position in which it is to be carried, in three motions.

Words of Command.  

Draw Swords.

1. Upon the word swords being uttered, direct the eyes to the sword-hilt, bringing the right hand with a sharp action across the body and over the bridle-arm to the sword-knot, placing it upon the wrist, and giving the hand a couple of turns inwards, in order to make it fast, at the same time seize the hilt, and wait in this position for the second motion, which will be made by the fleugel man on the right, the back of the hand is to be to the rear.

2. Draw the sword from the scabbard with a full extended arm, at the same time sink the hand till the hilt of the sword is immediately under the chin, with the blade perpendicular, and the back of the hand outwards.

3. Bring the hilt down, to be in a line with the bridle hand, the elbow
SLOPING of SWORDS.

KEEP the sword-arm in the exact position, pointed out for the carrying of swords; but dilate the second, third, and fourth fingers from the gripe of the sword, in order that the back of the blade may meet the hollow of the right shoulder, where it is to be supported with the edge directed to the front.

When in this position, the sword will be kept steady, and is to be without motion, at whatever pace the horse may be moving.
RETURNING of SWORDS.

THE sword is always to be returned from the carried position, and not from the sloped. This is likewise executed in three motions, dressing by the right.

Return Swords. 1. Carry the sword-hilt to the hollow of the left shoulder, having the back of the hand outwards, and the blade perpendicular, without pausing. Drop the blade (but not the hand) to the rear close by the left shoulder, directing the eyes to the scabbard,* in which the blade is immediately to be placed, and returned until the hand and elbow become in a line with each other, square across the body, and keeping the back of the hand directed to the rear.

2. Thrust the sword home into the scabbard, and loosen instantly the sword-knot from the wrist, keeping the hand upon the hilt.

* By resting the blade upon the bridle arm, the point will easily meet the scabbard.
Words of Command.

3. On the motion from the fleugel man, carry the right hand from the hilt with a smart action to the off side.

PREPARE to GUARD.

THIS is performed in one motion, and done by bringing the extremity of the sword-hilt up to the pit of the stomack, with the back of the hand outwards; the flat of the blade to the face, and carried perpendicularly. At the same instant, the bridle-hand must cross the body in a similar direction, and immediately under the sword hand, keeping the nails inwards and hand closed.

Let it be observed throughout the drill exercise, that each cut ends with bringing the sword back to its position in the guard, from which the recruit without waiting for any previous word from the drill officer, will come immediately down to the prepare to guard. This is to be continued as long as the motions are executed by a repetition of numbers.

It is when in this last position, that the drill officer will give his principal instructions on the mode of executing the movements following. It will ease the sword arm, that requires such relief; at the same time the constantly carrying
carrying out the arm to the guard, previous to every cut during this part of the exercise, will strengthen the elbow, and accustom the recruit to take a correct position.

GUARD.

FROM the motion to prepare to guard, the guard is done at once, by darting the sword hand forward with the same force, as in making a blow directed to the left ear of the opponent. This will cause the back of the blade to be towards the face; the edge of the sword should be turned in a trifling degree down, so as to raise the bevel above the level of the edge, in order to receive the cuts, rather than the edge which would be spoiled, at the same time that it causes the sword hilt to give the necessary protection to the wrist. The sword to be kept nearly in an horizontal position across the face, the point carried rather above the level of the mounting, and in an exact parallel to the front.

The right to be directed towards the antagonist, between the ear of the sword and the blade; the position of the blade is not to be altered for that purpose, but the edge invariably kept down as before directed; notwithstanding it has the effect of narrowing the focus, it occasions no impediment to the sight.

In this position the arm should be distended to the utmost, and of course the hand above the level of the shoulder.

* Plate VI. Bevel, &c.
shoulder: the bridle-hand always remains across the body, in the position of holding a bridle, except when the swords are flopped.

The greatest attention must at all times be paid to the correct position of the Guard, as it is not only of consequence by protecting the head and arm, but as from it, nearly every movement offensive to the front is made, and to it again, in all cuts, the blade invariably returns.

In this position the arm becomes a pivot, round which the wrist wheels the sword, independent of any other action but what may be derived from the shoulder: care must therefore be taken, neither to incline it to the right or left of the given position, nor to sink it below the level of the antagonist's left ear; but above all, not to bend the elbow: these are faults which beginners are extremely apt to commit, and which expose the sword-arm to be completely disabled. The attention cannot be too often recalled to these most essential points in the science; the strict observance of which chiefly constitutes the excellence of the system.

CUTS.

WE now come to the first Cut, in performing which the blade takes four distinct positions, which when perfectly executed, are not discernible, as the quickness of action
action in the wrist gives them the appearance of being only one motion: therefore to assist the comprehension of beginners, it will be necessary in the drill to distinguish the changes of the blade, by the separate pauses of 1, 2, 3, 4.

It is to be remarked, that the first motion in every cut consists in bringing the blade back to gather a sweep, at the same instant placing it in the direction in which it is to be applied, and the last motion brings the blade back to the guard. The plates (7, 8, 9, 10, 11, 12,) describe the exact position of the hand, in the different motions contained in each cut.

Words of Motions. Guard.

FROM the guard, upon the word one, by the sole action of the wrist, draw back the blade, so as to bring the point in a perpendicular line with the outside of the right shoulder, for the purpose of making a sweep: taking care at the same time, to turn the joints of the fingers in the same direction the cut is to be made, which will be in a diagonal course, as from 1 to 4. (Plate 1. fig. 2.)

And
And it is to be considered as an invariable rule, that the direction of the finger joints regulates the edge of the blade.

2. By a quick motion of the wrist downwards, with proper attention to direct the point to number 1, the blade will be conducted to number 4.

3. Turn the wrist inwards, dropping the point so as to bring the blade in a diagonal line across the body, with the edge outwards.

4. Bend the back of the hand inwards, bringing the flat of the blade towards the face, and carrying on the motion of the wrist, till the blade arrives at its original position in the guard, taking care at the same time, that in raising the blade, it makes a sweep inwards just to clear the elbow of the bridle hand.

The recruit having been trained to perform the above in four distinct motions with precision; drop the repetition of figures, and let him perform them very slowly, as one motion, and then increase the quickness of execution, till the cut is correctly made, with force, carrying the preceding notion for conducting the edge and finger joints.

C Turn
ing a proper edge, and without giving action to the elbow; observing the same rule in the five following cuts. It must be constantly a part of the drill officer’s instruction to his squad, not to hold their swords too tight; but to allow the hilt to play in the hand, by the second, third, and fourth fingers being diffused or contracted, as may be necessary to accord with the motion of the blade; taking care invariably to hold the gripe firm with the fore-finger and thumb.

### Words of Command

#### Motion 2.

#### The second cut is made upon the principle of the preceding one. The blade takes four distinct positions, and will, in the drill practice, be treated accordingly.

#### Guard.

**Cut II. in four Motions.**

1. Upon the word *one*, retire the blade across the face, till the point becomes nearly perpendicular to the elbow of the bridie hand.

2. By the action of the wrifh conduct the blade in the diagonal line from two to three, (plate I. fig. 3.) observing in the execution thereof, all the rules laid down in the preceding lefson for conducting the edge and finger joints.

C. Turn
Words of Command. Motion.  

3. Turn the wrist to the right, till it has brought the back of the hand under, the nails of the fingers and inside seam of the right sleeve upwards; at the same time keeping a firm grasp of the sword with the fore-finger and thumb, relax the other three fingers, which will occasion the point to sink, and the blade to arrive in a diagonal position, similar to the line 2 and 3, with the edge outwards.

4. Turn the hand to the left, till it brings the sword to its original position in the Guard, observing well, that in raising the blade, it makes a sweep round the right shoulder, clear of the head.

The next cut, viz. from fig. 3 to 2 (plate I. fig 4.) is made in three motions.

Guard. Cut III. in three Motions.

1. Drop the point outwards to the right, by turning the wrist in that direction, and relaxing the grasp of the three fingers of the sword hand, keeping at the same time a firm hold with the fore-finger and thumb: this will bring the blade in a diagonal line, similar to the one
one drawn from the numbers 2 and 3, (plate I. fig. 4) with the back of the blade towards the body.

2. Conduct the point of the sword from number 3 to number 2, by bending the wrist towards the face, and pressing upon the three distended fingers, which act as a lever.

3. Come to the original guard by turning the nails under, and back of the hand up.

Too much attention cannot be paid to suppling the wrist, and the drill officer will instruct his squad in the mode of doing so, which is by a repetition of the 1st and 2d motions in cut III. several times successively, without making any pause on either motion.

Every lesson should begin with suppling the wrist, and which must be frequently repeated during the hours of drill: in which practice the recruit will direct his attention to the steadiness of his arm, which is to be straight, keeping the hand above the level of the shoulder.

C 2  
Cut
Cut IV is likewise performed in 3 motions.—By turning the wrist to the left, it will drop the point in a diagonal line across the body, within three inches of the left elbow, and with the edge of the sword outwards.

Carry the point from No. 4 to 1, (plate I. fig. 5.) diagonally, by extending the hand in a direct line with the arm.

Double back the hand to its original position in the Guard, without carrying the blade round the head to the right, as it would make the motion wider than is necessary.

The cut V. is made horizontally across the face, from ear to ear, and executed in three motions.

Carry the point of the blade round to the right, with the edge directed outwards, till it reaches a little below the level of the sword-hilt, and inclined towards the right shoulder. This is done by turning
Words of Command.  

Motions: turning the back of the hand under, and bringing the nails up.

2. Conduct the point to No. 5, and horizontally across the circle, which is done by inclining the hand inwards in the direction of the cut, without changing the position of the nails. (Plate I. fig. 6.)

3. Turn the wrist into its proper position in the Guard, by bringing the back of the hand up.

Cut VI. has the same number of motions as the preceding one.

Guard.

1. Retire the point of the blade within a foot of the left shoulder, sinking it a little below the level of the sword-hand, which is done by an inclination of the wrist towards the face.

2. Conduct the point to No. 6, and horizontally across the circle to No. 5. (Plate I. fig. 7.) by carrying the hand out in that direction, keeping the back of the hand still upwards.

3. Bring
Bring the blade in a sweep round the right shoulder, and clear of the head to its position in the Guard, by turning the back of the hand under, and inclining it outwards, till the blade is brought nearly to the head; then turn the back of the hand to the face, and it will conduct the blade to the Guard.—Slope Swords.

In the foregoing motions, the beginner is apt to carry his right shoulder too forward, and likewise to incline his head to the sword-arm. He may be allowed to do both in a small degree, but by no means to excess; and on no account should the recruit be permitted to proceed farther in the system than these six cuts, till he is perfect master of the preceding directions.

THE manner of performing the six cuts singly being attained, the next object is to combine them, which will occasion some little deviation with respect to the mode of executing the second and fourth cuts, from the principles laid down in the preceding lessons; in which they are only treated of, as they are to be applied singly; but the whole executed together form a combined movement, which occasions the difference in the mode of practice.
In cut II. the sword is not to be carried round the right shoulder to the position to guard, immediately upon making the cut, but to be allowed to pause on the third motion of the second cut; in which position the blade will be in the exact direction for performing cut three; and where it is to remain 'till the word is given for making that cut.

In cut four, the change is in the second motion: where instead of bringing the blade to the guard in the third movement of that cut, drop the point to the right in the precise position of the first motion in cut V.; and wait there for the word from the officer to make that cut.

It must be obvious that the mode of executing the cuts two and four, according to the preceding directions, lessens the number of motions, and that each cut leads to the other; by which means, when the whole are quickly executed, the edge is carried with redoubled force, acquired by the velocity of action in the blade, in consequence of not being impeded in its course.

THE changes upon each cut necessary to a combined movement having been acquired, the recruit should be next taught to execute all the cuts quickly and as one movement, which in the course of future practice will be termed *the Assault.*

MODES
MODES of PARRYING.

WE now arrive at the different modes of parrying to the front: they are five in number, including the one already practiced, under the denomination of the Guard.

The left and right Protecță are the two following motions, which will be performed succeeding each other, without coming to the prepare between the intervals of their performance.

Words of Command.

Guard.

Left Protecță.

From the guard, carry the sword-arm smart across the body to the left, raising the point of the blade, till it becomes perpendicular; keeping the hand above the level of the shoulder: at the same instant, place the thumb on the gripe, between the back plate and the car, (plate VI.) which will turn the edge of the sword to the right, and the back outwards to receive the cut: the arm to be kept as far from the body as the position will admit.

The elbow in this as well as in the next motion is to have no action whatever, as the whole must proceed
Words of Command. proceed from the shoulder and wrist.

Right Protect. Without changing the direction of the blade, as held in the foregoing position, carry the sword-arm briskly to the right, directing the hand to the distance of two feet from the edge of the circle, above the level of the shoulder. 

Return to the prepare to guard.

To preserve uniformity in the motions of left and right protect, which are both applied on the same principle, it was necessary to distinguish the immediate points to which the hand was to be directed; but when opposed to an enemy, their application must depend on the direction of the cuts or thrusts, which they are intended to parry.

The utmost attention must be paid not to oppose the edge to the enemy's sabre when it can be avoided; but the bevel, which can only be done, by placing the thumb between the back plate and the ear of the sword, and keeping it firm in that position, the arm to be properly defended, for the purpose of resisting the force of the blow.

The only difference necessary to be observed in coming to the protect from the prepare, in the place of the guard is, that before the hand moves to the position directed,
directed, the thumb must be shifted to the place on the gripe already described.

The two following motions are for the protection of the horse’s head, at the same time with that of the rider.

**Words of Command:**

Direct the point of the blade forwards to the left of the horse’s head, and in a diagonal line from the hand, which is not to droop, but to be carried a little forward, in order to afford the protection required either from cut I. or III.

The edge will be upwards in this instance, but it must necessarily be exposed, from the nature of the guard.

**Horse, off side Protect.**

Raise the blade till it becomes perpendicular, carrying it at the same instant in a brisk motion forwards, to the off ear of the horse, and in the exact position of Right protect; not forgetting to place the thumb in the direction therein mentioned.—Return to the prepare to guard.

The different guards to the front have already been described; we therefore now proceed to the retiring positions, which are performed upon a different principle, the
the arm being necessarily bent to carry the sword to the rear.

The three following guards must be executed succeeding each other, without coming to the prepare between the intervals of their performance.

Words of Command.

1. Guard.
   Bridle-arm Protect, in two Motions.

2. Turn the back of the hand under, which will cause the edge of the blade to be upwards: at the same instant, by bending the elbow and turning the wrist so as to place the palm of the hand in front, the blade will be conducted to the protection of the bridle arm, which position consists in having the sword-hilt above the helmet, with the blade crossing the back of the head, the point of the left shoulder, and the bridle arm; its edge directed to the left, and turned a little upwards, in order to
Words of Command.

to bring the mounting in a proper direction to protect the hand.

After protecting the bridle arm in two motions, it is to be performed without making any pause on the first motion.

Sword-arm Protect.

Without sinking the hand from the protection of the bridle-arm, or moving the arm from its former position, carry the blade round the back of the head to the right, by turning the wrist till the palm of the hand arrives opposite the helmet; the blade will then be in a diagonal line, with the point downwards, directed to the right, and the edge up.

St. George.

Bring the blade in a horizontal direction across the top of the head, with the edge upwards and the point to the left. This is done by turning the wrist up, so as to carry the blade round the back of the head to its position.

From the St. George, or head protect, come to the position to guard, by making that cut to the rear,
Words of Command.

Motions.

rear, which must frequently be applicable, whenever the three retiring guards are so; and which makes the full sweep of a semi-circle.

It is done upon the principle of the sixth cut, only giving edge to the rear, instead of the front; but as the mode of executing it deviates in some respects from former practice, it may not be amiss to give it in detail. It is performed in two motions from the St. George.

To the rear Cut, in two Motions.

1. By the right, turn the body to the rear as far as possible without moving the feet from the ground: at the same instant carry the blade to the rear, directing the edge as from 6 to 5, till it arrives in a right line with the arm, which will be at its full extent. The point of the blade to be kept upon a level with the shoulder. In this position the edge will be directed to the right, with the back of the hand upwards.

2. Turn the back of the hand down by
by a motion of the wrist to the right, and carry the point of the blade with a sweep over the left shoulder, to the proper position in the guard. After cutting to the rear in two motions, execute it without pausing upon the first motion. Return immediately from the guard to the position to prepare, without any word from the drill officer.

GENERAL APPLICATION of the POINT.

The motions offensive and defensive best adapted to the cavalry have now been considered; except what relates to the point. But as that is applied upon a general principle, whether against cavalry or infantry, it has been reserved till we come to treat of the infantry part of this system. It has been already mentioned, that the sword has three distinct movements when opposed to the infantry; and which can only be applied in two situations, on the near, or off-side of the horse. The movements consist in giving point, the parry and the cut.

In the drill practice, the motions in each movement will be distinguished by a repetition of numbers, according to the mode already pursued. But precision being
being once acquired, the recruit is to be ordered to execute them without making any unnecessary pause upon the different motions. Let it be observed, that the safety and advantage in giving the point, consists in opposing only a flank, and never a front to the antagonist, by which means the curve of a scimitar blade covers the body, whilst the guard protects the hand.

**Left give Point.**

---

**Words of Command.**

1. Without moving the foot, turn the head round to the left, keeping the body square to the front; at the same instant place the blade in a diagonal line across the body to the left, with the edge outward, and the point directed as to an object considerably below your own level.

This is to be done, by dropping the point immediately from the position prepare to guard, and bending the elbow till the knuckles of the sword-hand are a little above the level of the ear, and about six inches from the head. The forefinger and thumb are to be distended; the former on the grips, between the ear and back plate, in a line with the flat of the blade; and...
Words of Command.

Motion: and the latter on the back plate, in a line with the back of the blade, by which means the extremity of the sword-hilt will fall into the palm of the hand; which being pressed against the three remaining fingers will give a firm purchase, and the means of applying a steady point. The head will be turned to the left, and eyes to the extremity of the blade. The recruit will wait in this position for the word two from the drill officer.

To the rear Parry, in two Motions.

1. Without changing the position of the hand, extend the sword-arm to the front of your usual position, in order to take a sweep with the edge of the blade upwards, and kept well off from the body, upon the supposition of being on horseback, so as to prevent fire the arm towards the car as in D giving.

2. Dart the sword down in the direction in which it was held, to the utmost extent of the arm; taking care not to alter the position of the hand or blade, which should have the edge outwards, and the back of the hand up.
2. Bring the arm back with a quick motion to the rear, till the sword-hand arrives in a line parallel to the left ear, and six inches from the head; at the same instant raise the point, till the blade becomes perpendicular, with the edge directed outwards to the left, and the back towards the face.

Cut IV.

From the position in which the blade is left in finishing the parry, bring it back to the position in the guard; carrying the edge with a good sweep outwards, taking care not to cross with your blade parallel to your proper front, till it is brought considerably above the level of the horse's head; otherwise, the animal would be in danger of receiving the cut.

The following movement applies in acting against cavalry.

Front give point in two Motions.

1. Face to the right, by turning on the heels; at the same instant retire the arm towards the ear as in giving
giving point to the left; with this difference, that the hand is to be drawn as far back as possible, retaining exactly the same grasp of the sword. The flat of the blade to be upwards, with the edge directed to the right, keeping the point horizontal with the hand, and the sword carried above the peak of the helmet. The head is to be turned to the left, in the same direction with the point. Upon all occasions in giving point against cavalry, the sword is to be carried above the peak of the helmet, and by pressing the blade against the helmet it will be kept steady.

2. Dart the hand in the direction of your proper front, to the full extent of the arm; turning at the same time to the left about, keeping the blade still horizontal, and without changing the position of the hand, which ought to be with the back upwards.

Retire the blade in its horizontal direction to the right, in doing which, bring the back of the hand under and carry the blade immediately

Cuts V. VI.
Right give point, in two Motions.

1. Turn the head to the right as much as can be done without moving the body, which is to be kept square to the front; at the same time bring the sword-hand up to the ear, having the grasp as before, with the back of the hand up, and the edge of the blade in the same direction as in making the thrust on the near side, carrying the point as much to the right, as in the other instance, it was directed to the left of your usual front. The position of the feet being two inches asunder, the facings may be done in one motion, by turning on the heels.

2. Dart your sword down to the full extent of the arm, without changing the position of the hand.

Rear parry, in two Motions.

1. Without changing the position of the hand, carry the blade towards your front to gather a sweep; in doing which, turn the edge of the blade
Words of Command. 

blade up, and the back of the hand under. This will bring the back of the blade opposite to your front.

2. Without changing the position of the hand, by a sharp action of the sword-arm to the rear, carry the sword as far back as the arm will admit of, the hand to be on a level with the point of the shoulder, the blade carried perpendicular, with the edge directed towards the rear, and the back to the front.

From the party, bring the sword to the proper position of the guard, by carrying an edge with a good sweep outwards, and with the same precaution not to cross parallel to the front on account of the horse. Return from the guard to the position of slope swords.

execution of each separately; the motions having not the least reference to what may be their positions, when arranged under a proper system of exercise.

AFTER having attained to a tolerable degree of accuracy, the mode of executing separately the movements already laid down, it will be proper next to proceed to perform the sword-exercise by word of command, taking the motions at the same time from fleugel men, according to the principle observed in the manual exercise.

To front the wall will be no longer necessary, as it is to be supposed that the position of every cut as described on the circle (to which all former practice has been applied) must now be fully in the recollection of the recruit.

The head must follow the direction of every motion, two fleugel-men will therefore be necessary, one on each flank; who are to be careful to take up the time from each other, according to the change of position, or dressing point from right to left.

The distance of files will be laid down for the practice of the sword exercise in battalion and smaller divisions.

The battalion to be told off in wings, and ranks of threes.
TELLINGS OFF in BATTALION or DIVISION.

Words of Command.

Rear rank take distance for sword exercise.

March.

THE right and left hand men of the rear rank belonging to both wings, will retreat nine paces, dressing by the right.

The rear rank falls back and dresses by the pivots; the fleugel men will at the same time take their distances to the front.

From the center of the battalion open your files. March.

The men of the right wing instantly open out, placing their bridle-hands in the hollow of the left side, so as to barely touch with their elbows their left-hand files.

The left wing will open out, and upon the same principle insure the distance of files, by means of the right arms.

The rear rank to do the same.

Prepare to perform sword exercise.

Upon these words of command, the right subdivision of each wing will give the distances of files in the manner following.

The right-hand man of ranks by threes stands fast, the center man takes three paces to the rear of the right-hand file, and covers him.

The left-hand man of the division retreats six paces, and covers the two preceding file of his division.

The doubling files are all to step off.
Words of Command.

off with the right feet, the rear rank does the same, covering the front rank files.

March.

The right hand files of all the divisions stand fast: the left and centre men taking their distances as before directed: * officers and non-commisioned officers to the rear, except such as are told off in ranks of threes.

By this movement, the battalion will become fix deep.

As an awkward man may occasion a serious accident, by not exactly covering his file, it will be most safe to prove their distances, which is to be done as follows.

To the right, prove distance of files.

† Taking the motions from the fleugel-man, every man will point his sword to the right at the full extent of his arm, keeping the

* The non-commisioned officers to be one horse's length to the rear covering a file, the officers at the distance of two horses length.

† The right-hand men of the line remain with their swords flopped, having no distance to prove.

Words of Command.

blade horizontal, and in a line with the shoulder; the edge directed the same way, and the hilt held in the precise manner, as when giving point in that direction. The body to be kept square to the front, with the head turned to the right.

When each file has had time to see whether he has his proper distance, and corrected it where required, (which must be instantly done, with a steady eye and prompt decision) they will be directed to return to the position of slope swords.

On this word of command, the swords to be brought down together to the position directed.

To the front, prove distance of files.

This is to be done, in every respect according to the rules laid down for giving point to the right; carrying the sword forward with caution, so as not to wound the file in front, should the distance not have been preferred. The front rank remains with swords flopped, upon the
the principle laid down for the files on the flanks of the line.

Slope swords. The swords to return to the slope, the body kept square to the front.

SWORD EXERCISE ON FOOT.

The sword exercise consists of the motions already described, arranged in six distinct classes of offensive and defensive movements, with reference to their application in those situations which are most likely to occur in actual service.

Explanatory notes of the principles of application comprised in each movement will be given, and likewise further instruction as to the mode of executing the different motions, which being now combined with others, vary in some respects from the directions that have been laid down for performing them singly. As the sword exercise, when acquired, is to be executed by one word of command to each division of movements, the memory must be assisted as much as possible, in order to enable every person to recollect the motions, as they succeed each other: for which purpose the following leading points should be observed.

Each division of movements commences with coming to the prepare to guard, from the position of slope swords, and is succeeded by the guard.

The position prepare to guard always succeeds the last motion of the six cuts, to which position the sword is immediately to be brought, without pausing in the least on the last motion of the preceding movement.

The point is always given from the position to prepare, without first coming to the guard, excepting in the last division of movements; and notwithstanding that in the other five divisions it may be given to the right and left, yet between each thrust come to the prepare, as it is to originate from that position. The left and right protect are likewise made from the prepare to guard.

Each movement invariably concludes with the motions prepare to guard, the guard, and sloping of swords.

The memory will therefore have to charge itself only with the particular motions which belong to each of the six divisions of movements. This will be rendered perfectly clear by the words of command which characterize the movements, being distinguished by numbers.

WORDS
WorDsof Command.

Perform Sword Exercise by Word of Command.

First Division of Movements.

From which Fleugelman the
Motion is to be taken.

Prepare to guard. Right.
Guard. Right.
No. 1. Assault. Right.
No. 2. Left protect. Right.
No. 3. Right protect. Left.
No. 4. Prepare to guard. Right.
No. 5. Front give point. Right.
* Prepare to guard. Left.
Guard. Right.
Slope swords. Right.

It is to be an invariable rule to return to the prepare
to guard, upon the last motion of the sixth cut.

It is also to be recollected, that the head turns and re-
mains fixt in the direction to which the motion points.

* Drop the point, and bring it with a sweep round the left el-
bow to the prepare to guard.

The motions throughout the exercise are to be per-
formed sharp and correctly, paying strict attention to
the dressing points.

In this first division, there are only five motions which
are not conformable to the general rule already stated.

The points of dressing given opposite the words of
command, shew from which Fleugelman the particular
motions are to be taken; and it is to be considered as
matter of course, that the head and eyes follow the di-
rection of each motion.

Explanation of the first Division of Movements.

The assault represents the charge, where the six Cuts
are directed, indiscriminately to the right and left.

The protects are against the returning cuts of the
enemy.

The point is given on a supposition of the enemy's
retiring.

WORDS OF COMMAND.

Second Division of Movements.

Prepare to guard. Right.

Guard.

No. 1. Assault. Right.
No. 2. Guard. Right.
No. 3. Bridle-arm protect. Right.
No. 4. Sword-arm protect. Left.
No. 5. St. George. Right.

* No. 6. Rear cut. Right.

Slope swords. Right.

Explanation of the second Division of Movements.

The assault represents the charge.

Guarding the bridle-arm denotes being obliged to retreat, and as the pursuer will generally attack the near side, it is the safest position to receive him in, as it not only covers the arm, but as the pursuer passes, carry the blade forwards, by moving the hand in that direction, it will also give protection to the whole of the near side.

The sword-arm is supposed to be attacked by a second pursuer, the moment the first is gone past, who makes his advances on the off side, in consequence of seeing the attack on the near defeated.

In the defence of the sword-arm the head and shoulders are exposed, to which an offensive movement is made, and parried by coming to the position St. George; the retreat is completed by giving cut VI. to the rear.

WORDS OF COMMAND.

Third Division of Movements.

Prepare to guard. Right.

Prepare to guard.  
Guard.  
Slope swords.

* Cuts I. and II. are made on the off-side.

† Left parry is done in two motions. The first by bringing the sword-hand into the hollow of the left shoulder, upon the left motion in cut II. keeping the back of the hand outwards, and the point perpendicular. Second motion, drop the point of the blade as much to the rear of the near side as possible, making the circle by bringing it round to the front in the same position.

‡ As the defence is made to an attack on the near-side, in pursuit, the left proteéi must be carried as much to the left as the arm will permit; and the right proteéi, not to the off-side, as in an attack to the front, but in the direction of your horse's left ear.
Explanation of the 6th Division of Movements.

The modes of making an attack on the near side of a retiring enemy, with the means of defeating it; supposing it to be done in speed.

Give point to the right, and make cuts I. and II. by which time the enemy is supposed to have rode past.

Receive the enemy with the sword-hand in the hollow of the left shoulder, ready either to protect or parry; as he makes his thrust, drop your blade outwards; it will carry off his point. Cuts one and two are protected by the left and right protect; and by checking your horfe, let your opponent pass, and instantly give him the point.

As soon as each division of movements is correctly executed by word of command; it must then be performed by only one word, specifying the particular division of movements.

The motions are all to be taken from the fleugel-man, without waiting for any other command than the one already mentioned.

AFTER the exercise is performed, it will be necessary to bring the battalion into its proper formation, which may thus be done.

Word of Command.

Front, form line.

March.

Upon which the centre and left-hand men of divisions, run up and drefs by the pivot.

Rear rank close to the front.

March.

To be done according to the custom of the service.

To the centre, close your files.

March.

This is executed with the side step.
PART II.

DRILL ON HORSEBACK.

Before the sword exercise is attempted to be performed on horseback, it will be necessary to render the horses steady, by accustoming them to the fight of the sabre; which is easily effected, by frequently making the cuts five and fix to the front, and dropping the blade both on the near and off-side, as is done in saluting.

The regiment being mounted, and the swords drawn for the purpose of performing the sword exercise, the distance of ranks and files is to be taken as follows.

DISTANCE OF RANKS ON HORSEBACK.

Words of Command. The distance on the wings to be marked as directed in the foot practice.

Rear rank reins back for sword exercise.

March.

Prepare to perform sword exercise.

The rear rank reins back 4 horses lengths, and dress by the pivots.

The right subdivision of each wing, to mark the distance of files in the manner directed for the foot practice; allowing the distance of the third of a horse's length between head and croup.

March.

The centre and left files rein back, till clear of the standing flank, when they will file to the right, and dress by the pivots, taking care to cover correctly, by placing their horses square to the front.

The distance of files is to be proved, as executed on foot.

SWORD-EXERCISE WHEN MOUNTED.

Perform sword exercise in six divisions of movements, by fleugelman.

First division.

In completing each division of movements, the line will return to the position of slope swords, when they will remain seated steady, dressing to the right, and without the least motion whatever.

After
Words of Command. — After the pause of two seconds, the commanding officer will repeat the next word of command.

Second Division. — In the like manner he must repeat his commands through the remaining four divisions, which are comprised in the sword exercise.

The reins must be held very short, so as to enable the rider by the least action of the bridle-hand, to regulate the motion of his horse's head, in order to prevent the blade from being obstructed in its course; and that the tightness of the reins may not occasion any reining back, or impatience in the animal; take care to ease him by carrying the hand sufficiently forward for that purpose; at the same time feel his mouth without bearing a dead weight in that direction.

THE exercise must at first be performed slow, till great correctness of execution in every motion is attained.

In each cut, made either to the right or left of the front, the bridle-hand is to feel the horse's mouth to the opposite direction, in order to prevent the possibility of danger to the animal. If this is not done with judgment, the horse will become unsteady. The slightest inclination of the hand is sufficient for the purpose required, if the reins are properly held. There is no danger whatever of wounding the horse, provided the edge of the blade is kept outwards agreeable to the drill instructions; or of its being impeded in moving either to the front or rear, if attention is paid not to cross parallel to your front, till the point of the sword is brought above the level of the shoulder. Too much attention cannot be paid to these particulars, as on their observance, the safety of the animal and dexterity in the exercise of the saber in a great measure depend. The positions of carry and slope swords are the same when on horseback, as executed on foot.

In performing the six divisions of movements, it is to be observed as an invariable rule in coming to the guard, to rise in a small degree in the stirrup, but not clear of the saddle, and to return to the usual seat on horseback with the motion to slope swords.

The assault and the different guards both to the front and rear have no particular variation from the foot practice.

In giving point to the front, the toe of the left foot must be turned in to the horse's side, and the heel out, otherwise
otherwise it will be impossible to bring the shoulder up in the manner requisite for that movement.

The same rule must be observed in cutting to the rear. Whatever movement is made, whether applied to cavalry or infantry, the balance of the body must be preferred by means of the knees and thighs, without throwing the weight partially on either stirrup; as upon service, horses are very subject to slip through their girths, notwithstanding every possible attention that may be paid to remedy the inconvenience; therefore if the balance is not preferred, the saddle will turn and dismount the rider, of which many fatal examples have occurred.

SWORD DRILL: moving in CIRCLE.

In order to apply skilfully in actual service, the different movements of the sword comprised in this exercise, it will be absolutely necessary to acquire a firm seat on horseback. For this purpose the regiment must be trained by the riding-master, in squads of eighteen or twenty men, to perform the exercise in a correct seat, when moving round a circle in a hand gallop. The precise position consists in placing the foot so far into the stirrup, as to bring the inner part of the ball of the foot, on the outer rim of the stirrup iron.

From the hip bone downwards, the leg and thigh are
are to be turned round to the saddle, the knee joint nearly straight, the toes turned well in, and the heels sunk as low as they will admit of. According to these instructions, the knee and thigh will have to firm a grip on the saddle, that neither the loss of a stirrup, or any sudden motion of the animal can shake the rider from his position. The belly and chest are to be brought forward, whilst the points of the shoulders are pressed back, and the head carried well up. The only motion of the body below the saddle, is to be derived from the instep, and above it from the small of the back. Attention must be paid in every particular to the rules laid down for the soldier's position on horseback; as omission in any point would prevent his ever acquiring a firm feat. Great care should likewise be taken that the heels are sunk well down, otherwise the balance of the body, which ought to be thrown backwards will be brought forward, when a sudden halt is liable to displace the rider.

The length of the stirrups will be fitted to the under part of the inner ankle bone.

As in this mode of practice there are no fleugelmen, the motions are not required to be executed so exactly together, the object being principally to attain a correctness of execution, and a firm position on horseback.

The different movements will at first be executed by word of command at a walk, and the squad is not to be
be made to gallop till they have acquired a confirmed
feat, and execute their motions with spirit and precision.

When they perform in a gallop, the pace is to be
regulated by order, and after every division of move-
ments to be brought from the gallop to the trot, then
to the walk, and finally to be halted.

Want of exactness either in the position of individ-
uals or the execution of the exercise, must be promptly
corrected; and frequently it will be necessary to halt
them for that purpose, in order to instruct separately the
person who may require it.

As the exercise in circle is severe for the horses,
much is left to the discretion and judgment of the drill
officer, who is required to pay great attention in this
respect, and particularly in the forming of heavy cavalry.

The distance of a horse's length is to be preserved
between each file.

---

The SIX DIVISIONS of MOVEMENTS
Performed in Speed.

As soon as the squad is able to perform the exercise
moving in circle, let them execute the same in speed
upon a right line. For which purpose draw the squad
up at the extremity of a range of two hundred yards;
the drill officer placing himself at the intermediate dis-
tance, where he will be best able to see and correct
their movements.

Only one man is to perform at the same time, and
each person a different division of movements, till the
six are executed, and which will be repeated till the
squad has rode past as many times as may be thought
requisite. As each man concludes his division of move-
ments, he is to form at the opposite end of the range
from whence he set off, and fronting the remainder of
the party.

In this practice, as well as when riding in circle,
particular attention is to be paid to the dragoon's posi-
tion on horseback.

---

RUNNING at the RING.

Having acquired a firm seat on horseback, and
correctness in the execution of the sword exercise with
the horse in speed; the next qualification requisite, is to
attain precision in the application of the point and the edge.

Running at the ring is adapted for the particular
purpose of training the swordsman to carry his point
with certainty to any given space, which must be the
result of repeated habit, and long practice.

The mode of practice consists in giving point through
a ring,
a ring, which is suspended at the degree of height, which cavalry is supposed to occupy.

The ring is to be made of metal, and to measure in diameter five inches, the inner circle to be four inches, and the depth one quarter. This is the largest size which ought to be employed, and is only adapted to beginners, who must be progressively led in their practice from large to small rings, till they are enabled to give point with tolerable degree of certainty within the diameter of a crown piece.

In order to suspend the ring at the height required, a machine will be necessary, the particular construction of which will be exemplified in plate XXII. It will answer the purpose of placing the ring in all the different directions in which it can be requisite to apply the point.

This machine, which by way of distinction will be termed the ring post, must be placed in a situation where there is a tolerable even surface of seventy yards, allowing a range of fifty, or five and fifty, yards up to the ring, and fifteen beyond it, which will be more than space sufficient to check the most awkward horse.

In running at the ring, there are two things to be acquired; first, extreme precision in giving point; and secondly, great promptitude and dexterity in bringing the horse to the right or left about.
The person who is to run at the ring, will place himself mounted at the extremity of the range, (and when giving point to the front) opposite the ring.

His bit rein must be drawn up short, keeping it firm between his fore finger and thumb, in order that he may be able to check his horse within the shortest compass possible: he must be seated in his saddle with his sword flopped; the first ten paces he ought to move in a trot, and then put his horse into a canter, taking care that he leads with his off leg, at the same time the rider will press on his stirrups, by sinking the heel and straightening the knee, and bring his sword in the position of prepare to guard. As he approaches the ring, he must increase his speed, so as to arrive at it with considerable rapidity; when within fifteen yards, let him bring his sword to the position of the guard, and finally to that of giving point to the front the instant he is within distance to make the thrust. This he must do, directing the point to the center of the circle, which by being carried elevated a little above the level of the hand, must necessarily cause the ring to fall down to the sword mounting, provided the blade was properly directed.

The moment the point has been given, come to the sword-arm protect, check the horse and bring him to the

* In an attack of cavalry, no movement can be made without being in consequence open to a retort. It therefore must be an invariable rule after making an offensive movement, to come to the protection of the part exposed thereby. If putting your avant-
the right about, in order to get on the antagonist's near side before he can bring his own horse round; the advantages of which manœuvre will be obvious to persons acquainted with the principles of skirmishing.

Beginners are extremely apt to divide their attention in the direction of the blade, between the point and the ring, which, almost to a certainty, makes them fail in the proper aim, the fight being distracted between the two objects.

The mode that ought to be pursued, is to fix the attention entirely on the ring, and not to look in the least to the position of the blade, which will always follow the direction of the fight.

Whether in encountering your enemy, or in pursuing him, observe as an invariable rule, never to allow your horse to be in a line parallel with his at the instant of attack, as it would expose your horse's head unnecessarily. Therefore in receiving your antagonist on the off side, incline your horse to the left, when within the distance of a couple of yards of each other, in order that your sword-arm may meet him in a direct line. Whereas moving parallel, your horse's head would have been the first point within reach of his sabre. Upon the same principle, when in pursuit, turn your horse in the opposite direction to that in which you come up with your enemy. It will be necessary to attend to the same mode of advancing, when running at the ring, or in giving edge.

In giving point to the left, come with your horse to the left about, and to the right about when giving to the right or front.

The rules laid down for running at the ring in one direction, hold good with respect to the others, and the practice consists in giving point against cavalry to the front, on the off and near sides. Likewise against infantry, as practiced at the foot-drill, with this difference, that in place of the ring, a ball formed of canvas or cloth, and stuffed with hay, must be placed at the height required for foot practice.

APPLICATION of the EDGE.

PRECISION in the application of the edge is as necessary, in acting against cavalry or infantry, as of the point. It therefore is requisite to acquire correctness of execution by frequent practice, which in order to preserve the swords, must be addressed to substances of the least resistance. It will therefore be necessary to establish willow sticks lately cut, on the top of which place a turnip, or any other substance of as little resistance, and
against cavalry; and as the antagonist changes his ground, let the sword-hands shift accordingly: But, should he get round to the rear, then of course the guard must give way to the modes of protecting in that direction.

Running at the ring, and giving edge, may be practiced together with various combinations, in order to increase the difficulty of execution, and thereby render the swordsman more expert in skirmishing. This is to be done by placing edge-posts at different distances on each side of the range, to which the six cuts may be applied on the right and left, whilst moving in speed to give point.

Too much attention cannot be paid in attaining perfection in the lessons of running at the ring, and giving edge against infantry and cavalry; as in these are united horsemanship, and every offensive movement which form the basis of skirmishing.

It is not merely the ready execution of all the offensive and defensive movements of this system, as practiced under a form of exercise, that will render a person a perfect swordsman. Therefore, in order to become a master of the sword, it will be necessary to apply all its principles, by man opposing man, under certain limitations, in such a way as to call forth every possible exertion of skill in individuals, both in what relates to horsemanship, and the use of the weapon; for which purpose the drill instructions will extend to the attack and defence; a mode of practice the best adapted to those situations on actual service, in which soldiers are most likely to be engaged; as it obliges them to think for themselves, and to act independent of each other; which on service are, in a body of light troops, inimitable qualities. It likewise has the effect of training the horses to quit the ranks readily, and the dragoons to manage them entirely with one hand; whereas at present, they generally employ both, unaccustomed as they are to manoeuvre with swords drawn.

ATTACK and DEFENCE.

It will now be proper to point out the application of those movements contained in the six divisions, by instructing the soldier in the principles of the attack and defence, and shewing him the different points of attack, and the retort to be made under the local situation of each movement, for which purpose he is to be seated on his horse, and to remain stationary, in order to receive the attack of the drill officer, who will walk round him, making the different movements offensive, repeating, at the same time, the positions requisite to be adopted for defence, which repetition may be omitted as soon as the eye and execution of the dragoon are sufficiently quick to render it unnecessary.
He is to be trained equally to attack, as to defend, and as soon as a squad is formed, they may be drawn up in two ranks, in order that the rear and front rank men may attack each other alternately, after which the practice will extend to the attack and defence in speed.

At the beginning the drill officer will find it difficult to enforce a correct execution of the guards and cuts, it being frequently a fault with beginners to forget the principles of drill practice, the moment the attention becomes divided; for which reason more than usual care must be taken, to see that there is no deviation from the system, which requires the arm to be kept perfectly straight, in order that the wrist alone may act. The edge to be correctly carried, and the protecs made with the thumb so placed as to oppose the back of the blade to the movements of the antagonist.

Whenever a regiment is perfectly formed to the use of the sword, all practice in the modes of attack and defence may be executed with the flat and back of the blade in place of the edge. But in the first instance, it will be requisite for the men to be instructed to carry the edge, for which reason the blades of a corps may be preserved by appropriating a certain number of swords to be made use of alone at the drill.

If men are taught in early practice to carry correctly the edge in performing the six cuts, there is little danger of their being misled by their applying the flat of the blade in the attack, particularly as the practice they must
must necessarily have in running at the edge post, will be sufficient to confirm them in the means of carrying an edge whenever it is requisite to do so; however should any person be found sufficiently awkward to require his being brought back to the drill practice, to become correct in giving edge, it can easily be done.

ATTACK and DEFENCE in LINE.

OFFENSIVE.

Cut I. at the horse's head on the near side.

Cut II. at the horse's head on the off side.

Cut I. at the adversary's face off side.

Parry cut III. by linking the guard.

Cut I. at the thigh or body on the off side.

Parry cut VI. by the right protecț.

Make cut I. at the sword arm.

DEFENSIVE.

The defence is, near side protecț.

Horse, off side protecț.

Left protecț, and return cut III. at the antagonist's wrist.

Right protecț, resting the hilt of the sword on the knee, when return cut VI. at the adversary's neck.

Come to the sword-arm protecț.

Cut
OFFENSIVE.

Cut II. at the bridle-arm from the rear.
Give point at the back, near side.
Cut I. at the back of the head, near side.
Cut II. at the face, near side.
Cut I. at the horse's head, on the near side.

DEFENSIVE.

Bridle-arm protecț.
Left parry.*
Left protecț.
Right protecț.
Horse near side protecț, and as the adversary moves forward, return cut VI. at his sword-arm, at the same time press your horse up to his near side and give him the point, by which the attack is changed, and he in his turn becomes on the offensive.

It is to be understood that every movement from whichever quarter it may proceed, is made immediately from the position preceding it, without first coming to the guard between the motions.

* Upon the first motion of giving point being made by the adversary, drop from the bridle-arm protecț to the position requisite for parrying.

Pur-
Pursuit on the Near Side.

To be executed first in a Walk, and finally in Speed.

**ATTACK.**

- Guard.
- Right give point at the small of the back.
- Cut I. at the back of the head.
- Cut II. at the face.
- Cut I. at the horse's head on the near side.

**DEFENCE.**

- Bridle-arm protect.
- Left parry.
- Left protect, near side.
- Right protect, near side.
- Horse near side protect.

After parrying the cut directed at the horse's head on the near side, return cut VI. at the antagonist's sword-arm, pressing your horse at the same instant up to the adversary's near side, and give him point, which places him in his turn on the defensive, when the same movements are to be repeated, each alternately becomes the pursuer. The person pursued must be attentive in checking the pace of his horse, in order to enable his pursuer to come easily up with him, otherwise the object of practice would be frustrated, and in place of its being a lesson of instruction, it would be a trial of speed between the horses.

PART
PART III.

METHOD OF INSTRUCTION IN CLASSES.

The whole of the Drill Instructions are to be communicated to each person of the squad individually, for which reason it is necessary to establish Classes, and Degrees of progress in each Class, into which men are to be removed according to the proficiency they make in the exercise.

There are to be three classes, and in each class three degrees of progress.

The first (or youngest) Class comprises the instructions necessary to the foot drill, which are divided as follows:

1st Degree. The Cuts.

2d Degree. The guards and cuts performed according to drill practice.

3d Degree. The sword exercise performed by word of command and fleugelmen.

The Second Class directs the exercise on horseback.

1st Degree. Consists in the opening of ranks, taking distances of files, and performing the sword exercise in line.

2d Degree. The exercise moving in circle.

3d Degree. The exercise performed in speed.

The Third Class is a general application of the whole system.

1st Degree. Running at the ring and giving edge.

2d Degree. The attack and defence in line.

3d Degree. The attack and defence in speed.

DIRECTIONS to be observed with respect to the Drills.

The most active men, and best riders of a regiment, are to be first instructed in the sword exercise, without regard to their being non-commissioned officers or not.
PART IV.

REVIEW EXERCISE.

At a review or inspection of a regiment of cavalry, the exercise of the sword is (after the regiment has marched past and formed) to precede the evolutions, and is comprised in the following movements:

I. The Six Divisions performed in Line.

II. The Six Divisions in Speed.

III. The Attack and Defence in Line.

IV. The Attack and Defence in Speed.

The sword exercise performed in line will be executed by the whole regiment, and the other movements by only one division from each squadron.
I. *The SIX DIVISIONS performed in LINE.*

IT is not necessary herein to specify the words of command, requisite to be given in order to put a regiment through the exercise; as the opening of ranks, and doubling of files, are according to the mode laid down in the drill practice, and the whole being executed by fleugelman, the commanding officer will have only to particularize each division of movement, after which he will form up the doubling files, and close ranks.

II. *The SIX DIVISIONS in SPEED.*

**Words of Command.**

The ranks being closed, the divisions are to be formed by those men, who are previously appointed in each squadron, moving forward on the word *march,* forming at three horfes lengths in front of their respective squadrons, and dressing by the right.

In order to perform the exercise in speed, it will be requisite to form the four divisions in two lines on each flank of the regiment, with the whole fronting inwards. The two divisions of the left wing will be drawn up opposite to the intervals of the divisions upon the right,
and one subaltern will accompany each division. The range between the two lines should not be less than one hundred and fifty yards, and the distances of the divisions sufficiently great, to guard against any possibility of the opposing parties riding against each other.

**Words of Command.**

The divisions being formed in front of the line and told off in ranks by threes, the commanding officer will direct them to wheel outwards, and upon the word march, the two divisions of the right wing will wheel to the right, and those of the left in the opposite direction.

As soon as they are halted, they will again get the words march and trot, on which they will trot off beyond the flanks of the regiment, and wheel into their new alinement.

As each division arrives on its ground, it is to halt, and wait for the commanding officer's order to wheel up.

**Halt, Dress.**  
**March.**  
**Trot.**

When thus formed, the division of the third squadron will be opposite the interval of the two right divisions, with the fourth division upon its left.

**Wheel up.**

**Halt, Dress.**

**On receiving the caution to perform in speed, the right and left file of the front rank will move forwards a horse's length in front of their respective divisions, to be in readiness to spring forward upon the division being specified**; at the same time the flanks are to be kept complete, by passing from the center of the rank.

**First division.**

The advanced files of each division will have their horses well in hand, and at the word Division, move forward at an easy gallop, increasing their speed gradually: each file is to direct his horse in a right line to the front. Those of the right wing, on arriving at the extremity of the range, will form to the rear of the third and fourth divisions, whilst those of the left wing will form in the intervals; by which means, when the exercise is completed, the four divisions will be immediately opposite each other.

* As the divisions are to be performed in rotation, the trumpet may be substituted for the word of command.

† The officers will accompany the last file of their divisions upon all occasions.
Words of Command.

Attention must be paid to regulate the time requisite between each motion, according to the extent of ground, as every division of movement should begin and conclude at the opposite extremity of the range.

The whole are executed according to the directions given for performing the first division.

III. The Attack and Defence in Line.

As soon as the word exercise has been performed in speed, the commanding officer will wheel the divisions inwards, in order to attack and defend in line.

March.

On the word march, the divisions will wheel, forming two lines fronting the general; the dressing will finally be by the right, it will then be requisite to extend the front of each division for the purpose of giving the necessary distance between the files; therefore on

Words of Command.

To the center extend your front.
March.

on being directed to extend the front, the inner flank files will turn their horses fronting inwards, and on the word march, move forward at an easy gallop, to the center of the range, and instantly form up, the files taking their distance from the standing flank; the rear rank men will keep with their front files, and cover them exactly when formed: The divisions are to dress by the right, forming two lines, one in the rear of the other.

Rear ranks by files, to the right about turn.
March.

Forwards.
Halt, front.

The rear rank will be put to the right about in order to take the distance of four horses lengths to the rear.

The rear files will preserve their distances in marching to the rear, so as to cover their front rank men when fronted.

Attack and defence of the front line.

From this period the second line is to stand fast till the front has gone through the whole attack and defence, and is again wheeled back to its former ground.

G 3 The
Words of Command.

Rear ranks, March.

The rear rank will be in readiness to move forward; and on the word march being given will advance in line at a walk, directing their horses to the near side of their front rank men.

Prepare to guard.

The whole of both ranks will come to the prepare, on receiving the word to do so, from the commanding officer, who will give it when within the distance of six yards from each other, and they are to be brought immediately afterwards to the guards applicable to their respective situations.

Guard.

On being ordered to guard, the rear rank will guard to the front, and the front files come to the protection of their bridles arms.—The attack is to commence as in pursuit, by the rear rank giving point on the near side, when they will execute the different offensive and defensive movements pointed out in drill practice for the near side, and likewise those of the off-sides, as far as cut I.* at the sword-arm, which being parried, cut VI. is to be returned at the sword-arm of the rear files, who are to retire guarding themselves in that direction, at the distance of a horse's length, before they slope swords. When the rear rank arrives on its former ground it will halt, and wait for the word to come about.

Files about*.

Both ranks will go to the right about, at which time the front files will face each other.

Front rank, March.

The front rank will move to the attack of their rear rank men, directing their horses to the off side.

Prepare to guard.

Guard.

At the distance pointed out in the former attack, both ranks will be brought to the prepare to guard, and then the Guard.

The attacking of the rear rank is to commence with cut II. at the horse's head on the off side, when all the movements in which they have already been instructed, are to be correctly executed, con-

* See page 73.

* By single files to the right about.
Words of Command. | Cluding with making cut I. on the near side at the horse, and receiving cut VI, at the sword-arm. The front rank will then retire guarding the sword-arm, till at the distance of a horse's length, when they will come to the position of slope swords, and halt as soon as arrived on their ground.

Rear rank take close order. | March.

Close your files. | March.

Threes about, Wheel outwards. | March.

Halt, front.

The second line is in its turn to attack and defend, which being done, the files are to be closed, the divisions wheeled up on their own ground and fronted, dressing by those of the first line, where they will be ready to commence their attack in speed.

IV. The

THE attack and defence in speed will consist of the divisions filing successively past the general; the front and rear files attacking and defending alternately, which having done, they will return by the rear of the regiment to their places in squadron.

Words of Command. | ON receiving the order to attack and defend in speed; the first division of the right wing will file from its left by two's, the rear file commencing the attack on the front file, according to the mode pointed out in drill practice.

Right wing, by your left attack and defend. | March.

They are to move at a pace rather exceeding half speed, taking care to ride in a right line to the opposite end of the range, where the attack will cease; their swords are immediately to be sloped, the files to dress, and at a gentle trot wheel round the right flank of the regiment to their places in squadron. The files will succeed each
Words of Command.

each other at the distance of five
horset lengths, till both divisions
of the right wing have successively
rode past the General.

Attention must be paid, that
they all move off from the same
ground, which is pointed out by
the leading files.

Left wing, by your
right attack and de-
fend.

March,
The divisions of the left wing
will file off from the right, and are
in their turn to observe the rules
laid down for the divisions pre-
ceding, with this difference, that
as their course is to be left, they
will wheel round the left wing of
the regiment to their places in
squadron.
